

Google Sheets Invoice Generator

Bulk PDF invoices + Gmail drafts from one spreadsheet row each. Setup takes about 5 minutes. No coding, no add-on, no subscription.

What's in the download

- **InvoiceGenerator.gs**: the script you paste into your Google Sheet
- **sample_invoices.csv**: two example rows (optional, you can import it instead of using "Set up sheet")
- **Setup-Guide.pdf**: this guide

Step 1: Add the script to a Google Sheet

1. Create a new Google Sheet (sheets.new).
2. Click **Extensions** → **Apps Script**.
3. Delete the sample function `myFunction()`, then paste the whole contents of **InvoiceGenerator.gs**. Click the save icon.

Step 2: Enter your business details

At the top of the script, edit the `CONFIG` block:

Setting	What to put
BUSINESS_NAME / BUSINESS_DETAILS	Your name or company, address, email, tax ID (shown on every invoice)
PAYMENT_DETAILS	How clients pay you (bank, PayPal, etc.)
CURRENCY_SYMBOL / CURRENCY_DECIMALS	e.g. '\$', '€', '£'; use 0 decimals for currencies like JPY
TAX_RATE / TAX_LABEL	e.g. 0.2 and 'VAT'. Use 0 for no tax line.
DUE_DAYS	Days until payment is due (default 14)
INVOICE_PREFIX	Invoice numbers look like <code>INV-2026-0001</code> and count up automatically
CREATE_GMAIL_DRAFT	<code>true</code> = also create an email draft with the PDF attached
OPENAI_API_KEY (optional)	Leave empty to use the built-in email template. If you add a key, AI writes a friendlier email. AI never touches the amounts.

Step 3: Create the Invoices sheet

Reload the spreadsheet. A new **Invoices** menu appears. Click **Invoices** → **Set up sheet (first time)**. This creates the columns and two example rows. The first time, Google asks you to authorize the script. It is your own script running in your own account. Click *Advanced* → *Go to (project)* if Google shows the "unverified app" screen, which is normal for personal scripts.

Step 4: Fill rows and create invoices

One row = one invoice. Put line items in one cell, one per line (Ctrl/Cmd+Enter makes a new line inside a cell):

```
Homepage redesign ; 1 ; 450  
Extra page ; 2 ; 120
```

Then click **Invoices** → **Create invoices for new rows**. For each row not yet marked *Done*, the script:

1. calculates subtotal, tax and total,
2. saves a PDF to the Drive folder **Invoices (PDF)**,
3. creates a Gmail **draft** to the client with the PDF attached,
4. writes *Done*, the invoice number and the PDF link back into the row.

Nothing is ever sent automatically. Open Gmail → Drafts, check the email, and press Send yourself.

Troubleshooting

- **Status shows "ERROR: no valid line items"**: check each line is `Item ; Qty ; Unit price` with semicolons.
- **No Invoices menu**: reload the sheet; make sure the script was saved.
- **Re-issue an invoice**: clear the Status cell of that row and run again (it gets a new number).
- **Change the invoice layout**: edit the `makePdf_` function. Every line is commented.

Important

You are responsible for checking that your invoices meet the tax and invoicing rules of your country. The script calculates totals with standard rounding to 2 decimals. Check amounts before sending. Google's normal Apps Script daily quotas apply (plenty for small businesses).
